

# Simplified Instructional Computer (SIC)

---

- A hypothetical computer that includes the hardware features most often found on real machines
  - SIC standard model
  - SIC/XE
- Upward compatible
  - Programs for SIC can run on SIC/XE

# SIC machine architecture

## ■ Memory

- 8-bit bytes
- 3 consecutive bytes form a word
  - Addressed by the lowest number byte
- $2^{15}$  (32768) bytes in the computer memory

# SIC machine architecture

---

- Registers (5 registers / each 24-bits)

| Mnemonic | Number | Special use  |
|----------|--------|--|
| A        | 0      | Accumulator; used for arithmetic operations  |
| X        | 1      | Index register; used for addressing  |
| L        | 2      | Linkage register; the Jump to Subroutine (JSUB) instruction stores the return address in this register |
| PC       | 8      | Program counter; contains the address of the next instruction to be fetched for execution              |
| SW       | 9      | Status word; contains a variety of information, including a Condition Code (CC)                        |

---

- SIC does not have any stack. It uses the linkage register to store the return address.
- It is difficult to write the recursive program. A programmer has to maintain memory for return addresses when he write more than one layer of function call.

# SIC machine architecture

---

- Data formats
  - Characters
    - 8-bit ASCII codes
  - Integers
    - 24-bit binary numbers
    - 2's complement for negative values
      - $-N \Leftrightarrow 2^n - N$
      - e.g., if  $n = 4$ ,  $-1 \Leftrightarrow 2^4 - 1 = (1111)_2$ .
  - No floating-point numbers (exist in SIC/XE)

# SIC machine architecture

---

- Instruction formats

- 24-bits format

- Note that the memory size of SIC is  $2^{15}$  bytes
- X is to indicate index-address mode

- Addressing modes

| Mode    | Indication | Target address calculation |
|---------|------------|----------------------------|
| Direct  | x=0        | TA = address               |
| Indexed | x=1        | TA = address + (X)         |

# SIC machine architecture

---

## ■ Instruction set

### ■ Load and store instruction

- LDA, LDX, STA, STX

- Ex: LDA ALPHA  $\Leftrightarrow$  (A)  $\leftarrow$  (ALPHA)

- STA ALPHA  $\Leftrightarrow$  (ALPHA)  $\leftarrow$  (A)

### ■ Arithmetic instruction

- involve register A and a word in memory

- ADD, SUB, MUL, DIV

- Ex: ADD ALPHA  $\Leftrightarrow$  (A)  $\leftarrow$  (A) + (ALPHA)

### ■ Comparison instruction

- involves register A and a word in memory

- save result in the condition code (CC) of SW

- COMP

- Ex: COMP ALPHA  $\Leftrightarrow$  CC  $\leftarrow$  (<, +, >) of (A)?(ALPHA)

# SIC machine architecture

---

- Instruction set (Cont.)
  - Conditional jump instructions
    - according to CC
    - JLE, JEQ, JGT
      - test CC and jump accordingly
  - Subroutine linkage instructions
    - JSUB
      - jumps and places the return address in register L
    - RSUB
      - returns to the address in L

# SIC machine architecture

---

- Input and output
  - Input and output are performed by transferring 1 byte at a time to or from the rightmost 8 bits of register A
  - Each device is assigned a unique 8-bits code
  - Three I/O instructions
    - The Test Device (TD) instruction
      - tests whether the addressed device is ready to send or receive a byte of data
      - CC : < : ready
      - CC : = : busy
    - Read Data (RD)
    - Write Data (WD)

# Simple I/O example for SIC

- Page 19, Figure 1.6

|        |      |        |                                 |                           |
|--------|------|--------|---------------------------------|---------------------------|
| INLOOP | TD   | INDEV  | TEST INPUT DEVICE               | cc := denotes device busy |
|        | JEQ  | INLOOP | LOOP UNTIL DEVICE IS READY      |                           |
|        | RD   | INDEV  | READ ONE BYTE INTO REGISTER A   |                           |
|        | STCH | DATA   | STORE BYTE THAT WAS READ        |                           |
|        | .    |        |                                 |                           |
|        | .    |        |                                 |                           |
| OUTLP  | TD   | OUTDEV | TEST OUTPUT DEVICE              |                           |
|        | JEQ  | OUTLP  | LOOP UNTIL DEVICE IS READY      |                           |
|        | LDCH | DATA   | LOAD DATA BYTE INTO REGISTER A  |                           |
|        | WD   | OUTDEV | WRITE ONE BYTE TO OUTPUT DEVICE |                           |
|        | .    |        |                                 |                           |
|        | .    |        |                                 |                           |
| INDEV  | BYTE | X'F1'  | INPUT DEVICE NUMBER             |                           |
| OUTDEV | BYTE | X'05'  | OUTPUT DEVICE NUMBER            |                           |
| DATA   | RESB | 1      | ONE-BYTE VARIABLE               |                           |

## - Subroutine call and record input

- Page 20, Figure 1.7 (a)

|        |      |          |                                   |
|--------|------|----------|-----------------------------------|
|        | JSUB | READ     | CALL READ SUBROUTINE              |
|        | .    |          |                                   |
| .      |      |          | SUBROUTINE TO READ 100-BYTE RCORD |
| READ   | LDX  | ZERO     | INITAILIZE INDEX REGISTER TO 0    |
| RLOOP  | TD   | INDEV    | TEST INPUT DEVICE                 |
|        | JEQ  | RLOOP    | LOOP IF DEVICE IS BUSY            |
|        | RD   | INDEV    | READ ONE BYTE INTO REGISTER A     |
|        | STCH | RECORD,X | STORE DATA BYTE INTO RECORD       |
|        | TIX  | K100     | ADD 1 TO INDEX AND COMPARE TO 100 |
|        | JLT  | RLOOP    | LOOP IF INDEX IS LESS THAN 100    |
|        | RSUB |          | EXIT FROM SUBROUTINE              |
|        | .    |          |                                   |
| INDEV  | BYTE | X'F1'    | INPUT DEVICE NUMBER               |
| RECORD | RESB | 100      | 100-BYTE BUFFER FOR INPUT RECORD  |
| .      |      |          | ONE-WORD CONSTANTS                |
| ZERO   | WORD | 0        |                                   |
| K100   | WORD | 100      |                                   |

# Define storage

---

- WORD/BYTE
  - Reserve one word/byte of storage
- RESW/RESB
  - Reserve one or more words/bytes of storage
- Example

|       |      |      |
|-------|------|------|
| ALPHA | RESW | 1    |
| FIVE  | WORD | 5    |
| CHARZ | BYTE | C`Z' |
| C1    | RESB | 1    |

## Special symbols (SIC & SIC/XE)

---

- # : immediate addressing
- @ : indirect addressing
- + : format 4
- \* : the current value of PC
- C` ': character string
- op m, x : x denotes the index addressing

# SIC/XE machine architecture

- Memory
  - Maximum memory available on a SIC/XE system is 1 megabyte ( $2^{20}$  bytes)
  - Instruction format and addressing modes are changed
- Register (Additional registers)

| Mnemonic | Number | Special use                             |
|----------|--------|---|
| B        | 3      | Base register; used for addressing      |
| S        | 4      | General working register-no special use |
| T        | 5      | General working register-no special use |
| F        | 6      | Floating-point accumulator (48bits)     |

- Registers S and T are only for storing data. They can not use for accumulator
  - Ex: ADDR S, A                     $A \leftarrow A+S$   
      COMPR X, T

# SIC/XE machine architecture

## ■ Data formats

- There is a 48-bit floating-point data type

- sign bit s (0: +, 1: -)
- fraction f: a value between 0 and 1
- exponent e: unsigned binary number between 0 and 2047
- value:  $s * f * 2^{(e-1024)}$
- Ex:  $5 = 2^2 + 2^0 = (2^{-1} + 2^{-3}) * 2^3 = (2^{-1} + 2^{-3}) * 2^{1027-1024}$   
0,10000000011,1010000....0

# SIC/XE machine architecture

## ■ Instruction formats

- Since the memory used by SIC/XE may be  $2^{20}$  bytes, the instruction format of SIC is not enough.

- Solutions

- Use relative addressing
    - Extend the address field to 20 bits

- SIC/XE instruction formats

Format 1 (1 byte) 

|        |
|--------|
| op (8) |
|--------|

Format 2 (2 byte) 

|        |        |        |
|--------|--------|--------|
| op (8) | r1 (4) | r2 (4) |
|--------|--------|--------|

Format 3 (3 byte) 

|        |   |   |   |   |   |   |           |
|--------|---|---|---|---|---|---|-----------|
| op (6) | n | i | x | b | p | e | disp (12) |
|--------|---|---|---|---|---|---|-----------|

Format 4 (4 byte) 

|        |   |   |   |   |   |   |              |
|--------|---|---|---|---|---|---|--------------|
| op (6) | n | i | x | b | p | e | address (20) |
|--------|---|---|---|---|---|---|--------------|

e=0: format 3, e=1: format 4

# SIC/XE machine architecture

- Addressing modes
  - New relative addressing modes for format 3

| Mode                     | Indication | Target address calculation        |
|--------------------------|------------|-----------------------------------|
| Base relative            | b=1,p=0    | TA=(B)+disp (0 ≤ disp ≤ 4095)     |
| Program-counter relative | b=0,p=1    | TA=(B)+disp (-2048 ≤ disp ≤ 2047) |

- When base relative mode is used, `disp` is a 12-bits unsigned integer
- When program-counter relative mode is used, `disp` is a 12-bits signed integer
  - 2's complement
- Direct addressing for formats 3 and 4 if b=p=0
- These two addressing mode can combine with index addressing if x=1

# SIC/XE machine architecture

## ■ Addressing modes

- Bits x,b,p,e: how to calculate the target address
  - relative, direct, and indexed addressing modes
- Bits i and n: how to use the target address (TA)

| Mode                 | Indication | Operand value   |
|----------------------|------------|---|
| Immediate addressing | i=1, n=0   | <b>TA</b> : TA is used as the operand value, no memory reference  |
| Indirect addressing  | i=0, n=1   | <b>((TA))</b> : The word at the TA is fetched. Value of TA is taken as the address of the operand value |
| Simple addressing    | i=0, n=0   | Standard SIC  |
|                      | i=1, n=1   | <b>(TA)</b> : TA is taken as the address of the operand value   |

# Addressing mode example

# SIC/XE machine architecture

---

- **Instruction set**
  - Standard SIC's instruction
  - Load and store registers (B, S, T, F)
    - LDB, STB, ...
  - Floating-point arithmetic operations
    - ADDF, SUBF, MULF, DIVF
  - Register-register arithmetic operations
    - ADDR, SUBR, MULR, DIVR
  - Register move operations
    - RMO
  - Supervisor call (SVC)
    - generates an interrupt for OS (Chap 6)
- **Input/Output**
  - SIO, TIO, HIO: start, test, halt the operation of I/O device

# SIC/XE machine architecture

---

- **Instruction set**

- Refer to Appendix A for all instructions (Page 496)
- Notations for appendix
  - $A \leftarrow (m..m+2)$ : move word begin at  $m$  to  $A$
  - P: privileged instruction
  - X: instruction available only in SIC/XE
  - C: condition code CC

# Programming examples (SIC/XE)

## - Data movement
